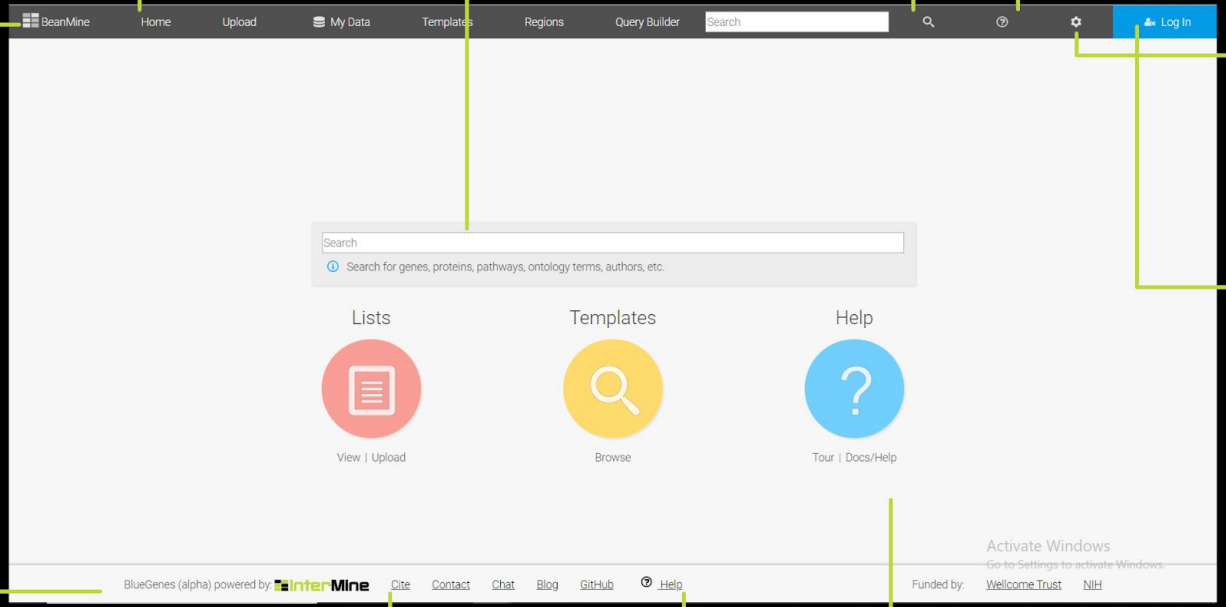
BlueGenes Redesign Concept

By Roshni Prajapati

ISSUES IN EXISTING DESIGN



Unnecessary button, 'Mine indicator button' on left-most can suffice the function

No extra search bar required if one is present on the top nav bar

again an icon which serves the same function as other existing element does hence useless

inappropriate position of icon. User flexibility comes into action as information must be presented in logical & natural order

User is tempted to click.
But no action on call!

this icon not needed at first place also it's misleading and conveys no obvious indication of it's functionality

Aesthetics could be improved. Site gives a quite dull and negative impression

icon is rarely needed here, word 'login' indicates it all

Branding should also be the head of the site.
At the footer goes quite unnoticed this way

could be presented in a more consistent and standard form

irrelevant and same data element at two places creates confusion state for user.

footer is most critical section of any website, it's the first place users go if lost. It's no good if one ignores this utilitarian section

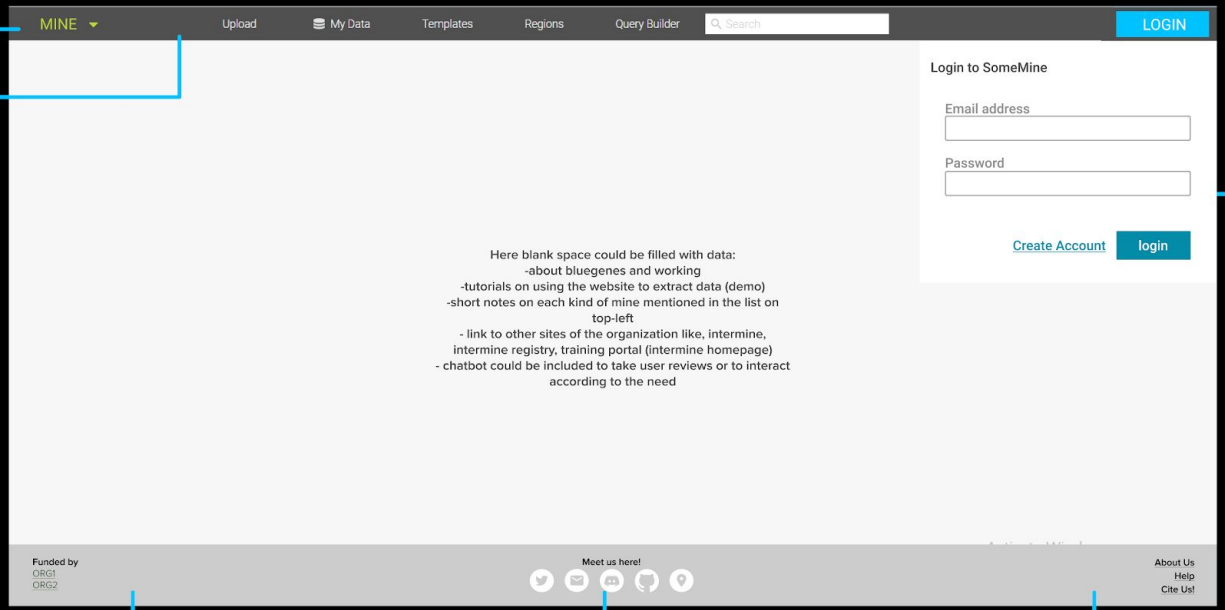
REDESIGN CONCEPT

It is important to mention organization and site base. We can add extra navbar for that detail, as for every named organization recognition is important

Clealy specifies user for list of mines. No other extra icon required

No home icon required. Clicking on the mine name will suffice. As both serve the same functionality

No icon required, word 'LOGIN' says it all



No logo required at login button
Make the actions just and clear
Signify actions 'Create account ' rather than making user to think for 'I don't have an account'

Almost of no importance, hence to the least scanned section of footer we can add 'funding' section

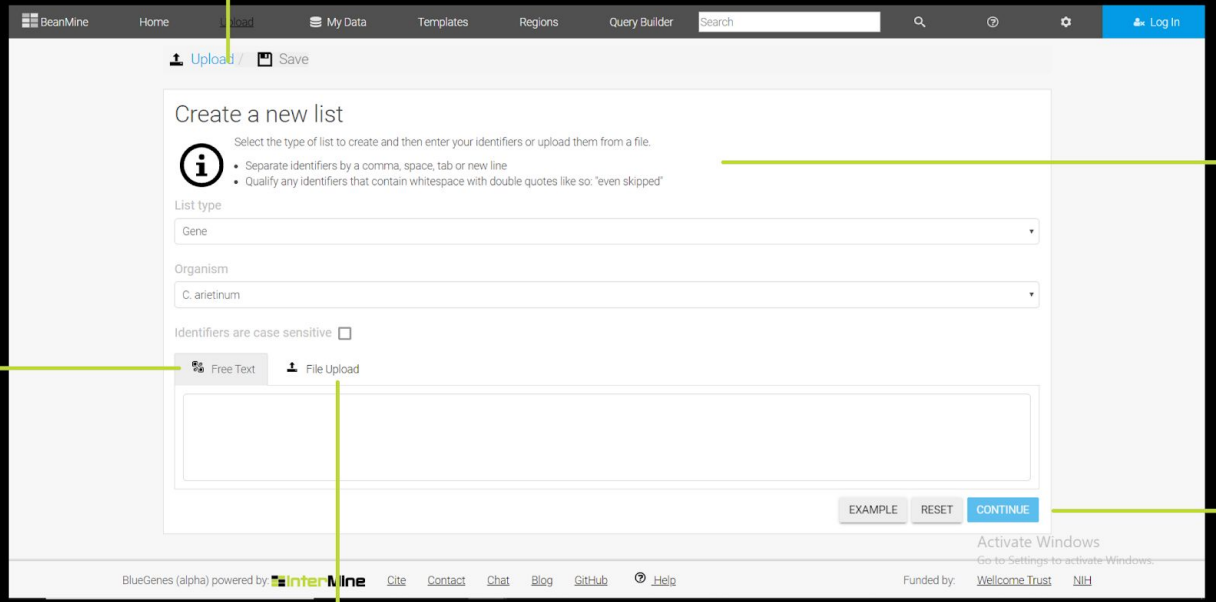
Every link presented in form of standard icons, makes it consistent

Informative data about the website shown in separate column on the footer

footer section divided into 3 sections depending on the data to clear out the view for users

ISSUES IN EXISTING DESIGN

Use of the button is ambiguous (takes to previous page or uploads a file somewhere?)



User should not have to remember information from one part of the dialogue to another. Instructions for use should be visible or easily retrievable whenever apt.

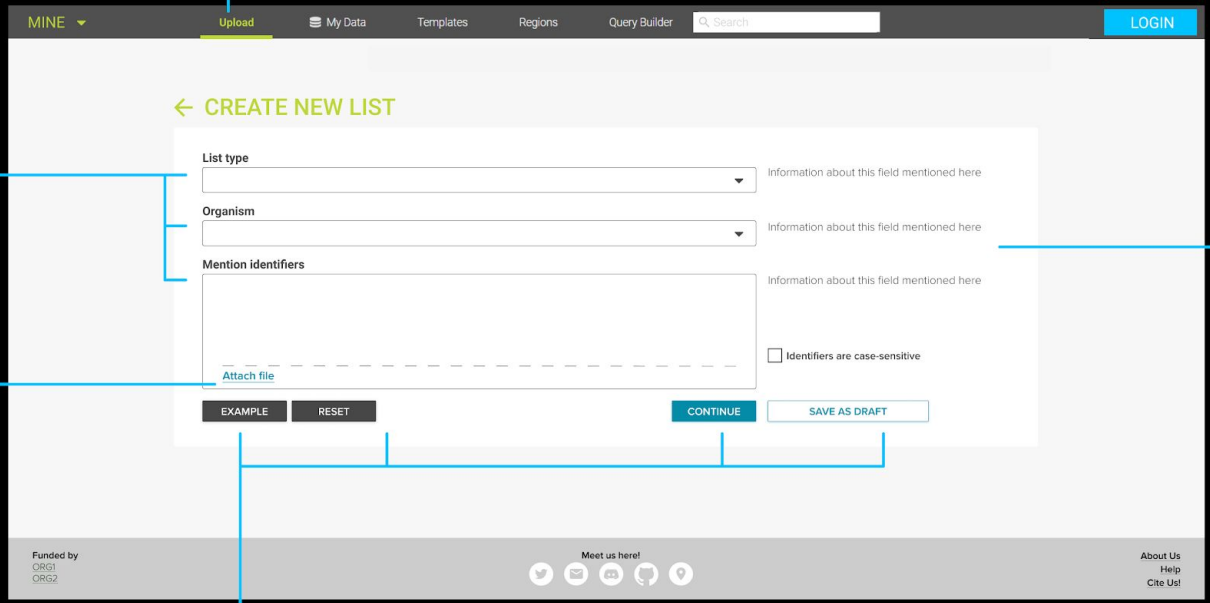
System must keep users informed what's going on the site, but here no clear specification to the user.

Aesthetics could be improved

Wrong use of tabs here. tabs are used for navigation or switching to totally different

REDESIGN CONCEPT

Highlighting the active tab should be properly shown



Mentioned which category is required. Keeps user informed at every step

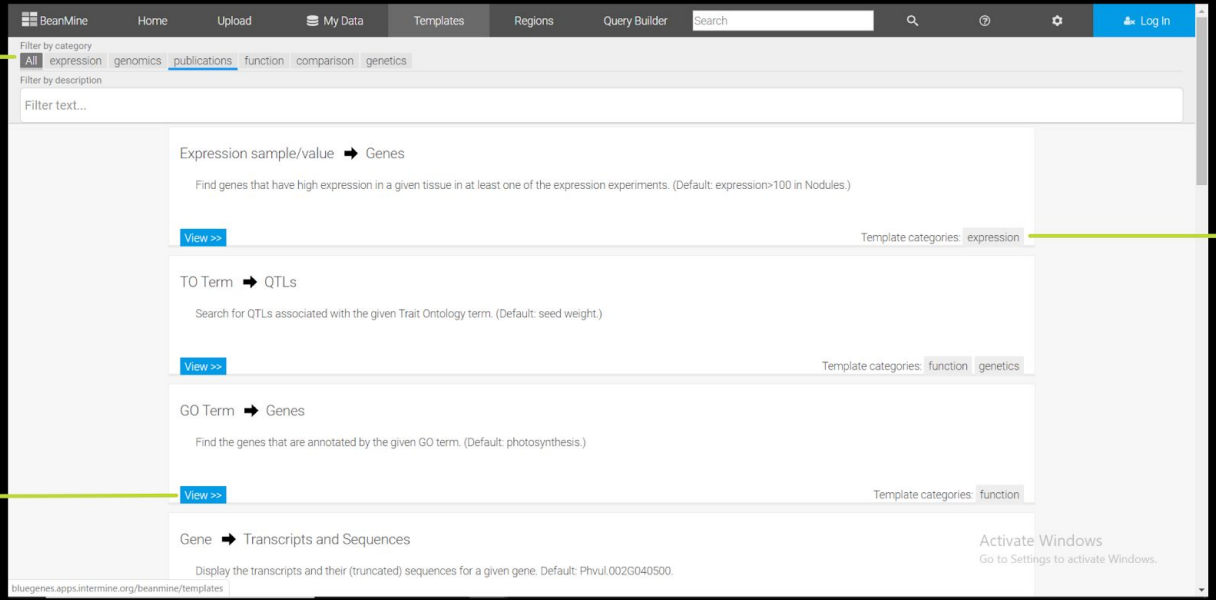
the data type for individual fields required in the field is clearly specified

Clearly expresses user to either attach file or input the data. User action is also clear now

Buttons of less priority separated to fasten the decision making

ISSUES IN EXISTING DESIGN

When number of data is more to be displayed as tabs, horizontal line is not the first option!
makes eye wander

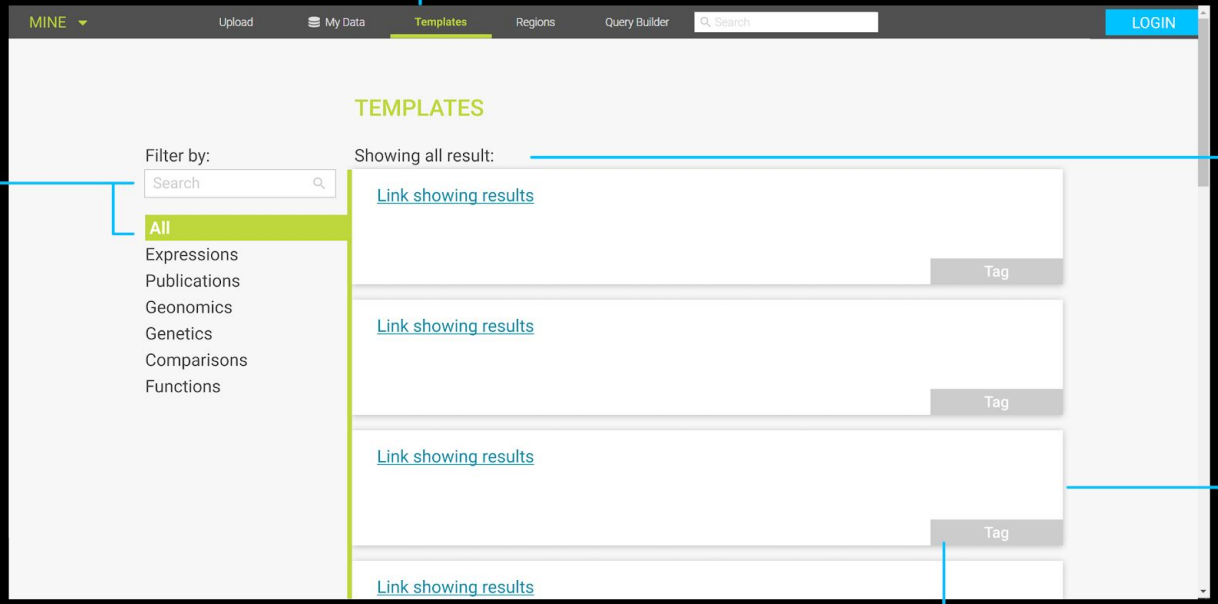


Unnecessary button.
If user needs to view more his/her instant action would be to click anywhere on the block displaying information

Obvious from category tab what the element, 'template category' is not required

REDESIGN CONCEPT

Highlighting the active tab should be properly shown



Clear search input along with vertical representation of the tabs makes function clear as well

title makes it clear which result is displayed

If we remove the 'view' button from result cards and make the whole card clickable then shadow signifies that card is clickable

Tag specifies the category is obvious no need to title it as 'template category'

Thankyou
